A: As linux-daemon suggests in the comments, you should download the file you want and extract it using unip e.g. \$ sudo unzip filename.zip Using unzip should allow you to decrypt the zipped file and extract the contents. The directory should now contain the file you want to get access to. If that does not work for you, you could always try to extract the file using 7-zip which is a free, open source zip-file-compressor used under Microsoft Windows and Linux. \$ sudo unzip filename.zip If that does not work, you could always try using the free and open source alternative to 7-zip, 7z. You can install it via: \$ sudo apt-get install 7zip A: Right click on your zip, choose "extract here", or use UNPACKER It is free and open-source software. The perfect solution Characterization of neuropeptides and their receptors in early development of the brain of Clupisoma platyra: Immunocytochemical findings. Brain development during embryonic stages of Clupisoma platyra is poorly understood. Neuropeptides and receptors are important components of the central nervous system and are involved in the regulation of a number of physiological processes during development of the brain. Here, we aimed to characterize the development of the neuropeptides and their receptors in this early fish. For the first time, we used anti-neuropeptide antisera to investigate the distribution pattern of neuropeptide-containing neurons in pre- and post-hatching C. platyra embryos. In the pre-hatching brains, immunolabelling was observed for all four well-established neuropeptides (PACAP, secretoneurin, somatostatin, and galanin). Our findings indicate that some of the neuropeptides were already present in CNS of early embryos, and there is no evidence that some of the neuropeptides involved in the regulation of the maturation process of the brain (e.g. PACAP, galanin, somatostatin). The somatostatin-like immunoreactivity in the pre-hatching brains was confined to the periventricular zone of the diencephalon and rhombencephalon with no evidence of rostral/caudal, left/right lateral

The transport of various organic cation and anion molecules in aqueous solution is investigated using Molecular Dynamics. A range of parameters is used, including mass, charge, orientation in the solvent, and preferred orientation within the cavity. It is found that cations prefer to enter the cavities of the anion systems in orientations where at least one anion is closest to them. The cation movements are much more restricted than those of the anions, which is consistent with the accepted model. The efficiencies of transport were found to be related to the polarizabilities of the molecules. The electrostatic interactions between cations and anions were found to play a minor role in the transport of these molecules.The internet is already changing the way we communicate - but soon it could get personal.
